

Deuterated water in W33A

Floris van der Tak, Fabrice Herpin, **Charlotte Vastel**, Yunhee Choi
Groningen, Bordeaux, Toulouse

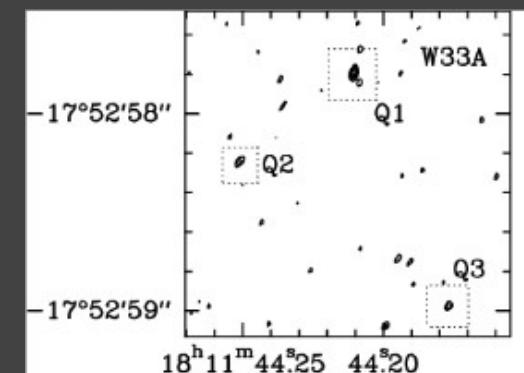

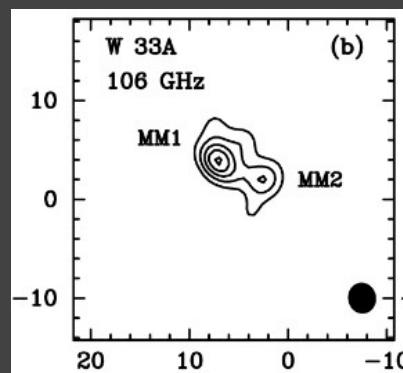

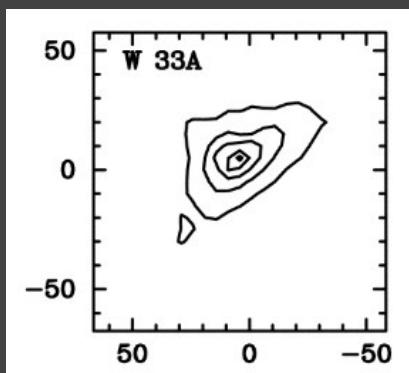

Some source basics

- High-mass star-forming region
 - prominent binary
- Luminosity $10^5 L_0$
 - Gürtler et al 1991
- distance 4 kpc
 - Rengarajan & Ho 1996
- Bright in mid & far IR
 - Willner et al 1982, de Wit et al 2007
- Weak radio source
 - van der Tak & Menten 2005

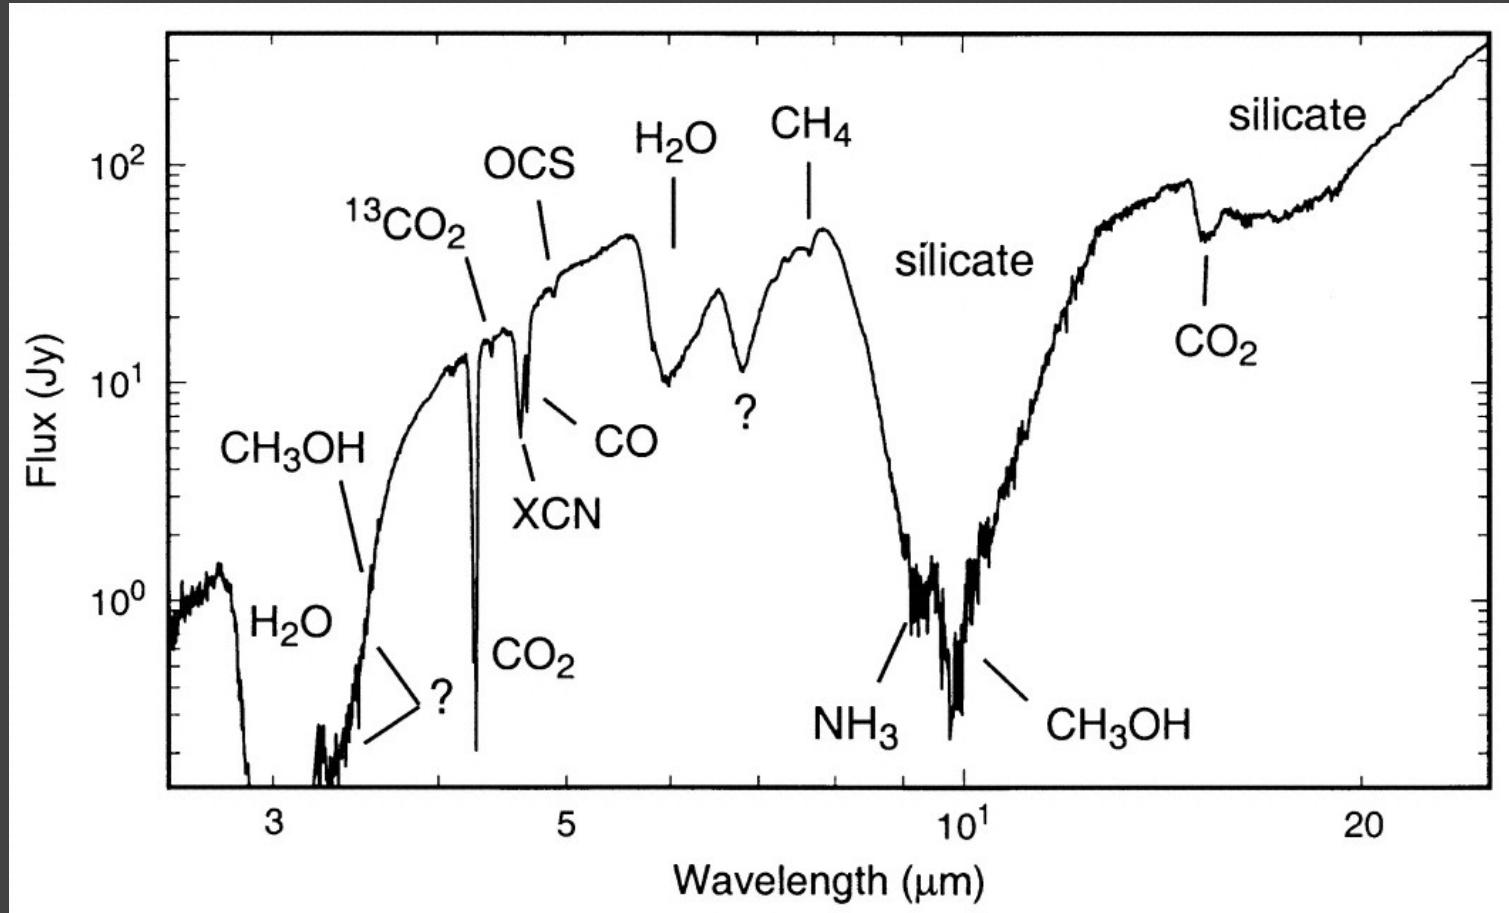

Vastel 2002

FvdT et al
2000, 2005

SRON

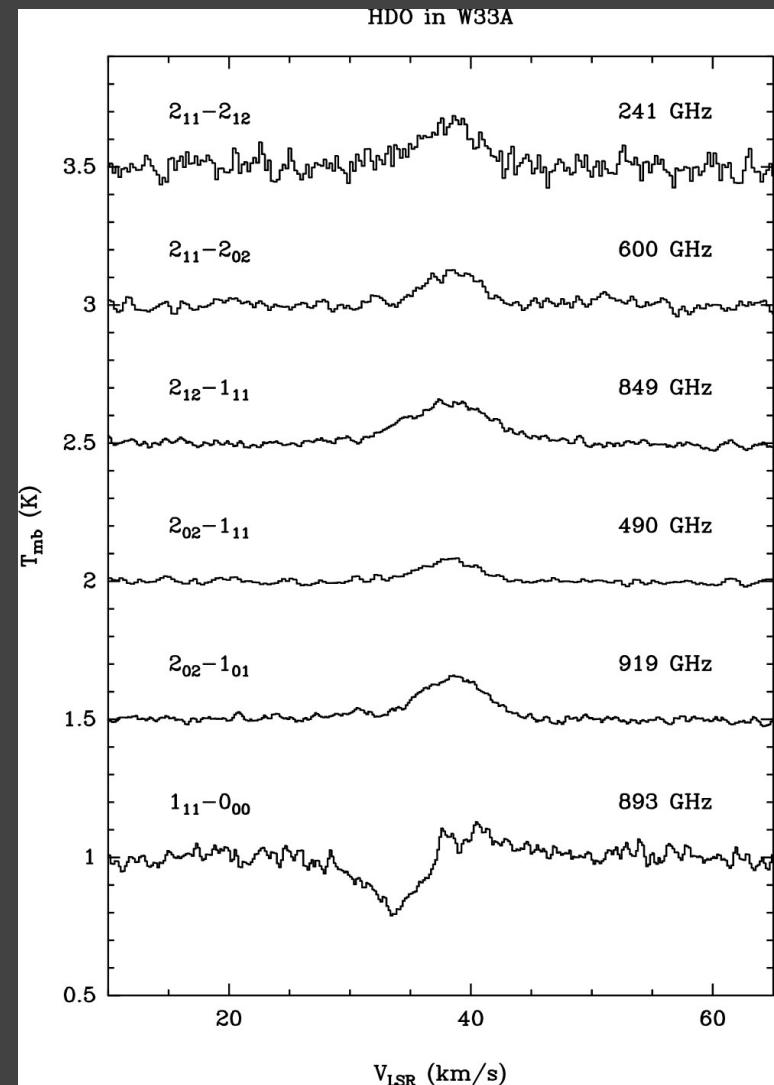

A classic ice source

- ISO-SWS spectrum: Gibb et al (2000)
- Solid HDO claimed (Teixeira et al 1999)
 - but rejected by Dartois et al (2003)

Our HDO data: HIFI / IRAM

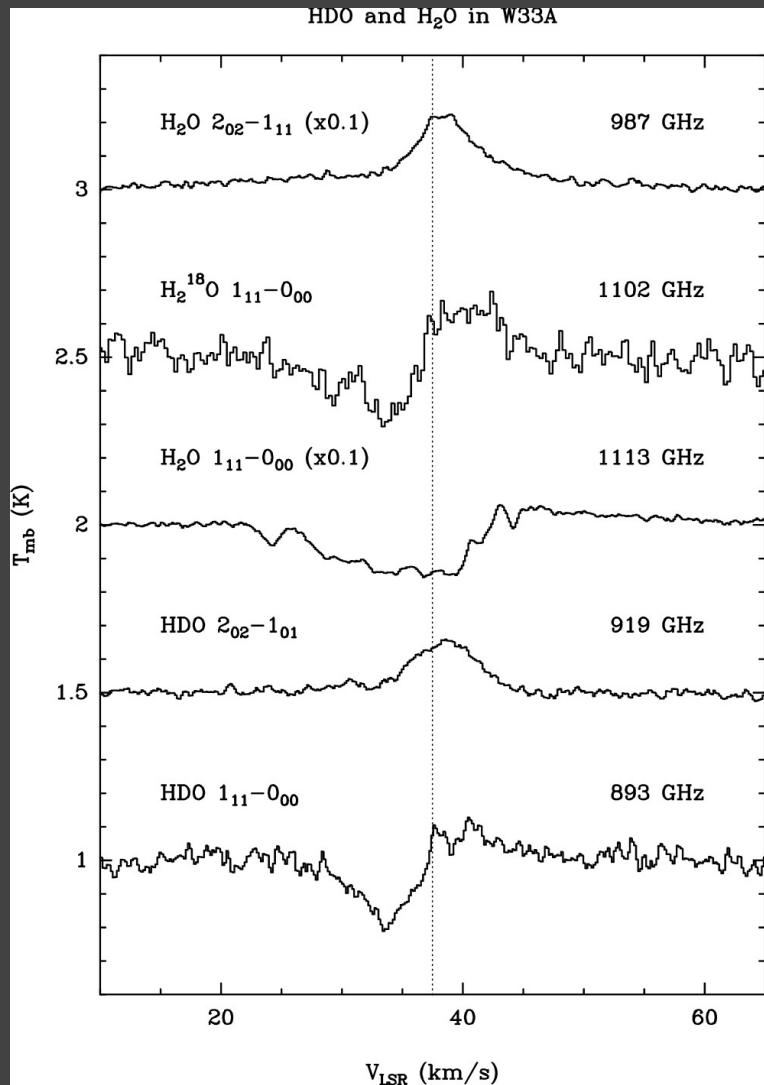

- Ground state: absorption
 - $V_0 \sim 33 \text{ km/s}$
 - $\Delta V \sim 5 \text{ km/s}$
 - does not look saturated
- Excited states: emission
 - $V_0 \sim 38 \text{ km/s} = \text{systemic}$
 - $\Delta V \sim 5 \text{ km/s} = \text{as from ground}$
 - $T_{\text{mb}} \sim 0.1\text{--}0.2 \text{ K}$
- Wing on blue side
 - envelope + outflow
 - or inverse P Cygni?

Comparison to H₂O

- H₂O ground state: absorption
 - cold outer envelope
 - outflow wing
- excited H₂O line: emission
 - inner envelope
 - outflow
- H₂¹⁸O line: P Cygni profile
 - just like HDO
 - use this to compare

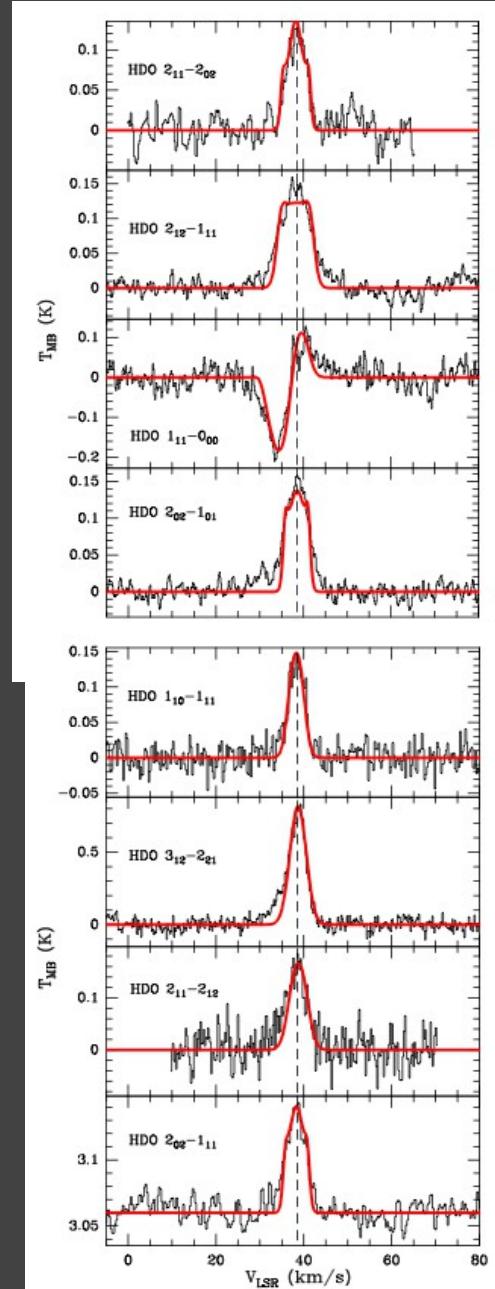

FvdT et al 2013 (submitted)

Model of the HDO line profiles

- Model tool: Ratran 1D
 - $n(r)$, $T(r)$ from continuum (L. Chavarria)
 - CRC: Faure, Wiesenfeld et al 2012
- Kinematics:
 - turbulence 1.5–3.0 km/s
 - expansion 1.2 km/s ...
 - ...only in 226 & 893 GHz lines ?!
- Abundances
 - 4(-10) in outer envelope
 - 4(-7) in inner envelope
- 2006 model: abundances 1(-8) & 2(-7)
 - ground-state: more precise outer value
 - inner value: structure has minor effect

80, 225 GHz lines: FvdT et al 2006

Next steps

- Ratran model for H₂O (Yunhee)
 - kinematics: similar turbulence / expansion velocities?
 - chemistry: HDO/H₂O ratio as a function of radius
- put results in context
 - other sources
 - chemical models
 - trends of HDO/H₂O ratio with source parameters (L , M , ...)
